

VBORNET

"European Network for Arthropod Vector
Surveillance for Human Public Health"

AGM 2012, Riga

WP3: Vector surveillance and distribution maps

Period 4

Francis Schaffner

WP3 – Vector surveillance and distribution data

- Main objective: *“To maintain and update existing **databases for vector distribution and surveillance**, and create new databases for arthropod vector surveillance based on available data”*
- Executing agency: ITM, Antwerp, Belgium
- Officer in charge: Marc Coosemans ITM, WP3 coordinator
- Vector focal points:
 - Francis SCHAFFNER, Avia-GIS (Zoersel, BE), Mosquito validation
 - Laurence VIAL, CIRAD (Montpellier, FR), Tick validation
 - Bulent ALTEN, Hacettepe Univ. (Ankara, TR), Phlebotomine validation

WP3 – Main outputs Period 4

- Maintenance of existing surveillance and distribution maps
 - Gap analysis in collaboration with WP1.5
 - Distribution of malaria vectors in countries at risk of malaria transmission
-
- www.vbornet.eu
 - http://ecdc.europa.eu/en/activities/diseaseprogrammes/emerging_and_vector_borne_diseases/Pages/VBORNET_maps.aspx

WP3.1 – Maintenance of existing surveillance and distribution maps

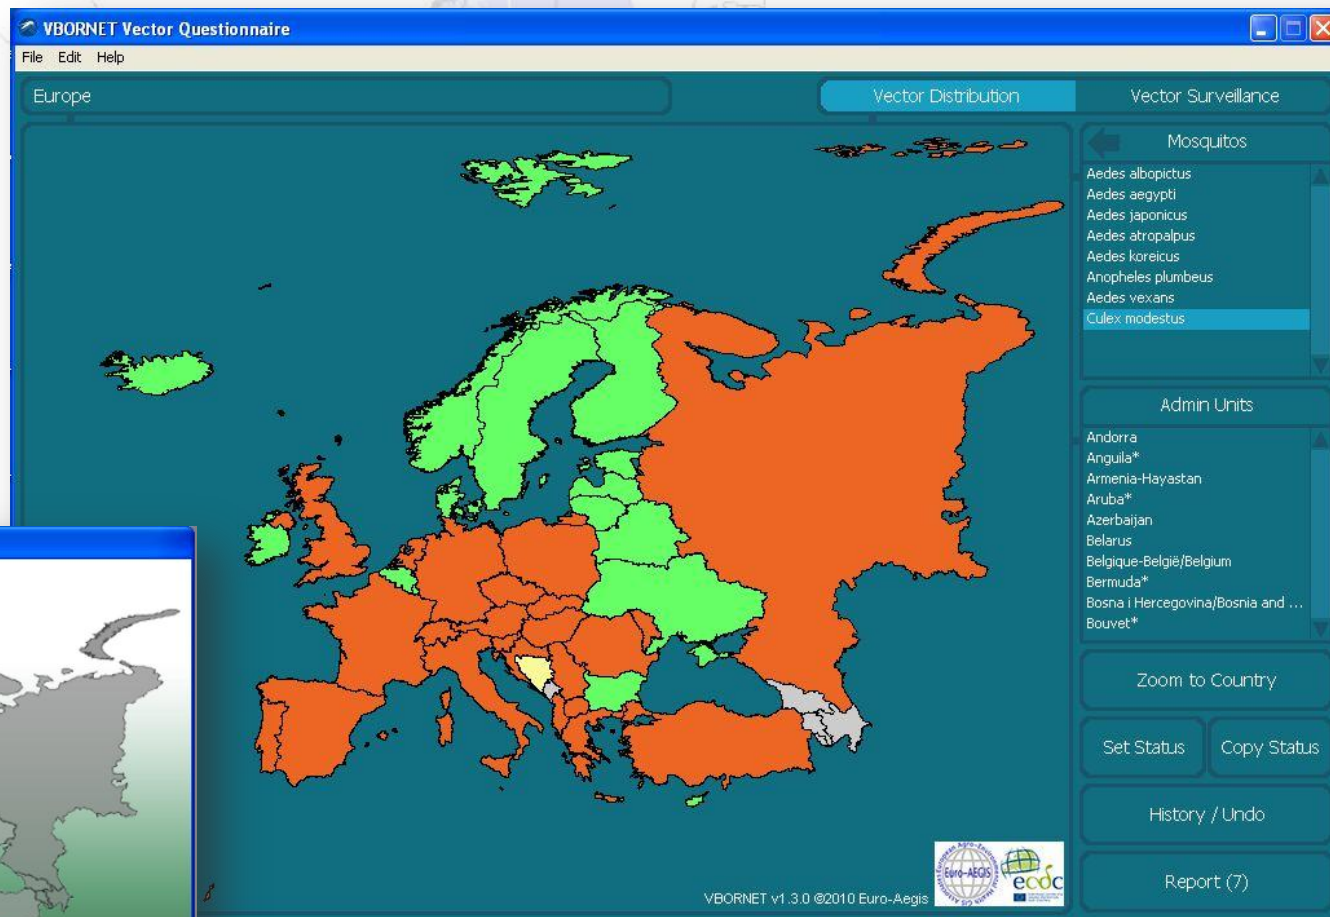

- Update of maps (mosquitoes, ticks and phlebotomines) developed in previous years
- Production of new maps on a three monthly basis: April 2012, July 2012, October 2012, January 2013
- For each map: gap analysis (collaboration with WP1.5) where needed areas of confirmed absence will be identified based on expert advice
- Model outputs generated under WP1.5 to fill identified gaps, to be assessed and integrated in the database

WP3.2 – Malaria vectors

- Distribution data on malaria vectors collected and mapped with focus on countries at risk for local malaria transmission
- Species selected with ECDC, including at least: *Anopheles labranchiae*, *An. sacharovi*, *An. atroparvus*, and *An. plumbeus*
- All newly designed databases created in close coordination with ECDC to ensure consistency with other ECDC mapping tools for public health purposes

Data collection and processing

- Direct reports from experts via Vector Questionnaire

Data collection and processing

- Direct reports from experts via Vector Questionnaire

- Role of experts:

- ✓ Enter reports
 - ✓ Surveillance
 - ✓ Vector distribution (field data)
 - ✓ Expert identification
 - ✓ Data publication

- Role of focal point:

- ✓ Validate expert's reports
- ✓ Attribute a status to each unit, based on:
 - Expert's reports
 - Up-scaling of reports
 - Absence of reports

Data collection and processing

- Direct reports from experts via Vector Questionnaire
 - Very soon: new online tool
- Reports from focal point based on:
 - Information from experts (e.g. excel sheets with geographical coordinates or NUTS)
 - ‘Historical’ and ‘recent’ data: published scientific papers, books, thesis, administrative or scientific project reports, museum material and their references, validated checklists, validated data banks, congress presentations, personal communications, etc.
- Validation process
 - Step 1: Validation of the data source and the distribution status
 - Step 2: Validation of the species identification
 - Step 3: Validation of the location
 - Special cases: Validation of multiple reports

Validation process

- Step 1: Validation of the data source and the distribution status
 - Data source (for ticks only):
 - **Acceptable (1)**: Data reported from human, mammal, amphibian and reptilian hosts.
 - **Not acceptable (0)**: Data reported from birds and bird nests
 - Distribution status: As VBORNET maps show distribution of established vectors, interception (in means of transportation) and sporadic observation related to transportation and without establishment are not validated as presence data.
 - **Acceptable (1)**: Data reporting presence and establishment (reproduction of the vector on one site and several observations made over at least one year, or reproduction of the vector on several sites)
 - **Not acceptable (0)**: Data reporting observations in means of transport
 - **Not acceptable (0)**: Data reporting observations on one site of introduction without evidence of reproduction on site and establishment

Validation process

- Step 2: Validation of the species identification
 - Validation of the expert: Is this expert fully trustable or not? If not, removal of all his/her reports or those that seem aberrant
 - Validation of the identification method: Are some methods more reliable than others? Checking of the report and the used methods.
 - **Not acceptable (0):** Only a report of presence, except:
 - (a) If the expert is a well-known and/or trustable scientist,
 - (b) If the VBORNET focal point personally knows the location and considers the report as highly probable.
 - **Acceptable (1):** A report of presence + use of a referenced identification key
 - **Acceptable (2):** A report of presence + use of identification key + expert validation
 - **Acceptable (3):** A report of presence + use of identification key + molecular identification
 - For ticks, a marking from 0 to 3 is adopted for possible use to rank data (so far saved in focal point's database and not included in VBORNET database and not shown on VBORNET maps)

Validation process

• Step 3: Validation of the location

- If geographic coordinates (with reference system) are given: possible to locate in VBORNET subunits (NUTS)
- If only location is indicated: ask the expert to locate the report in NUTS
- If only location is indicated and if not possible to ask specifications: use of Google or Gazetteer maps to identify the different possibilities of locations and types of locations (also the case for published data)

1. One possible location:

- **Acceptable (4):** A point (locality...)
- **Acceptable (3):** A seat of an administrative area, if restricted to one NUTS
- **Not acceptable (0):** An extended area connected to several NUTS (large administrative area, mountain, river...)

2. Several possible locations:

- **Acceptable (2):** One point and extended areas, referring to the point
 - **Acceptable (1):** One seat of an administrative zone and extended areas, referring to the seat
 - **Not acceptable (0):** Several points
 - **Not acceptable (0):** Several extended areas
- For ticks, a marking from 0 to 4 will be adopted for possible use to rank data

Validation process

- Special cases: Validation of multiple reports
 - Several data can be reported for the same species and unit (NUTS), for the same period of report
 - **If congruent:** all data are validated by the procedure described above and the matching status is attributed
 - **If contradictory:** all data are submitted to the validation procedure as described above and status is attributed according to the most recent data (of the field observation) that is validated
 - Several data can be reported over different periods of report for the species and unit (NUTS) that have already a status
 - **If congruent:** the newly reported data is validated and the matching status is attributed
 - **If contradictory:** the newly reported data is submitted to the validation procedure and the status is attributed according to most recent validated data

Validation process

- Validation tool: VBORNET Vector Validator

VBORNET Vector Validator

Mosquitoes

Coordination and data validation: Francis SCHAFFNER

Mosquitoes

- Period 1: Invasive species
 - Distribution maps: *Aedes aegypti*, *Ae. albopictus*, *Ae. japonicus*, *Ae. koreicus*, *Ae. atropalpus*
 - Surveillance map: all invasive species
- Periods 2 & 3: Other main known vectors
 - *Aedes vexans*, *Anopheles plumbeus*, *Culex modestus*
- Period 4: Main malaria vectors
 - *Anopheles labranchiae*, *An. sacharovi*, *An. atroparvus* (*An. plumbeus* already included)

Current surveillance Europe

Invasive mosquitoes

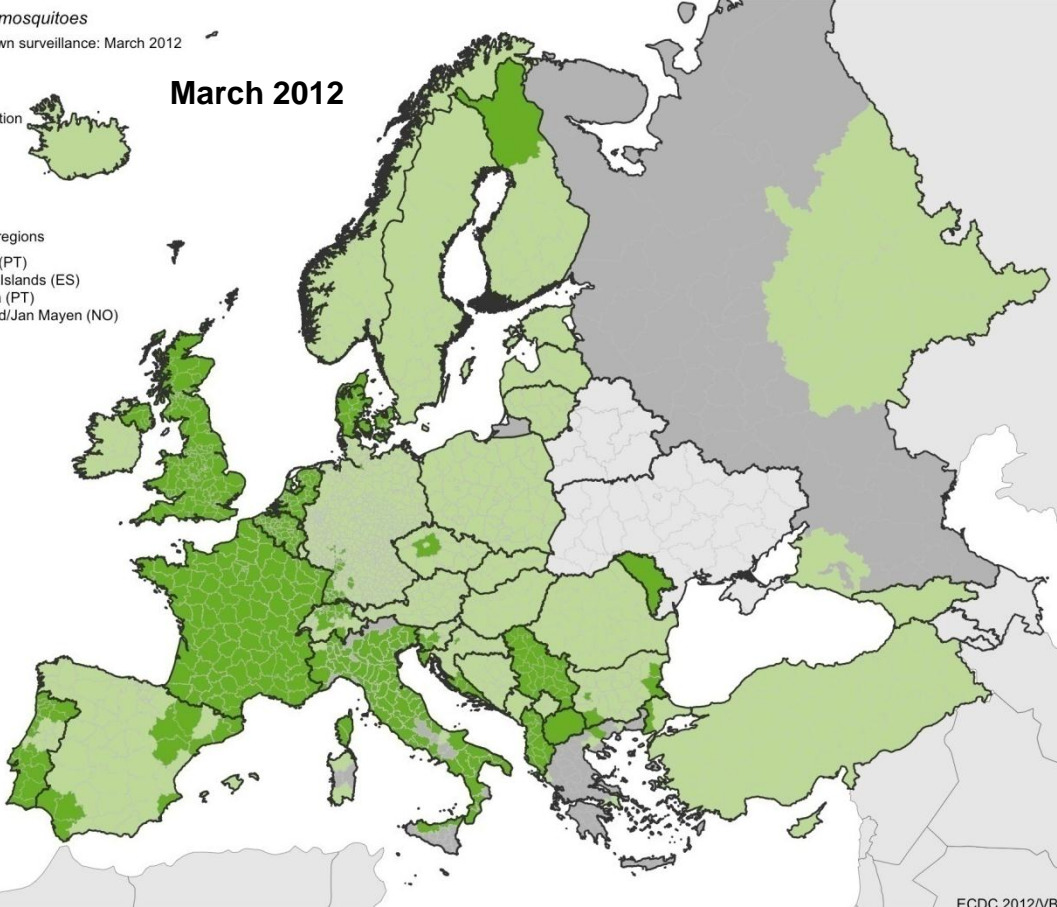

Current known surveillance: March 2012

- Yes
- No
- No data
- No information

March 2012

Outermost regions

Mosquitoes – Perspectives

- Updating maps for invasive species
- Other vectors: NUTS 3 data from literature and experts
- *Anopheles* species: compile data from literature and experts
- Specific cases: finding experts from Armenia, Azerbaijan, Belarus, and Ukraine

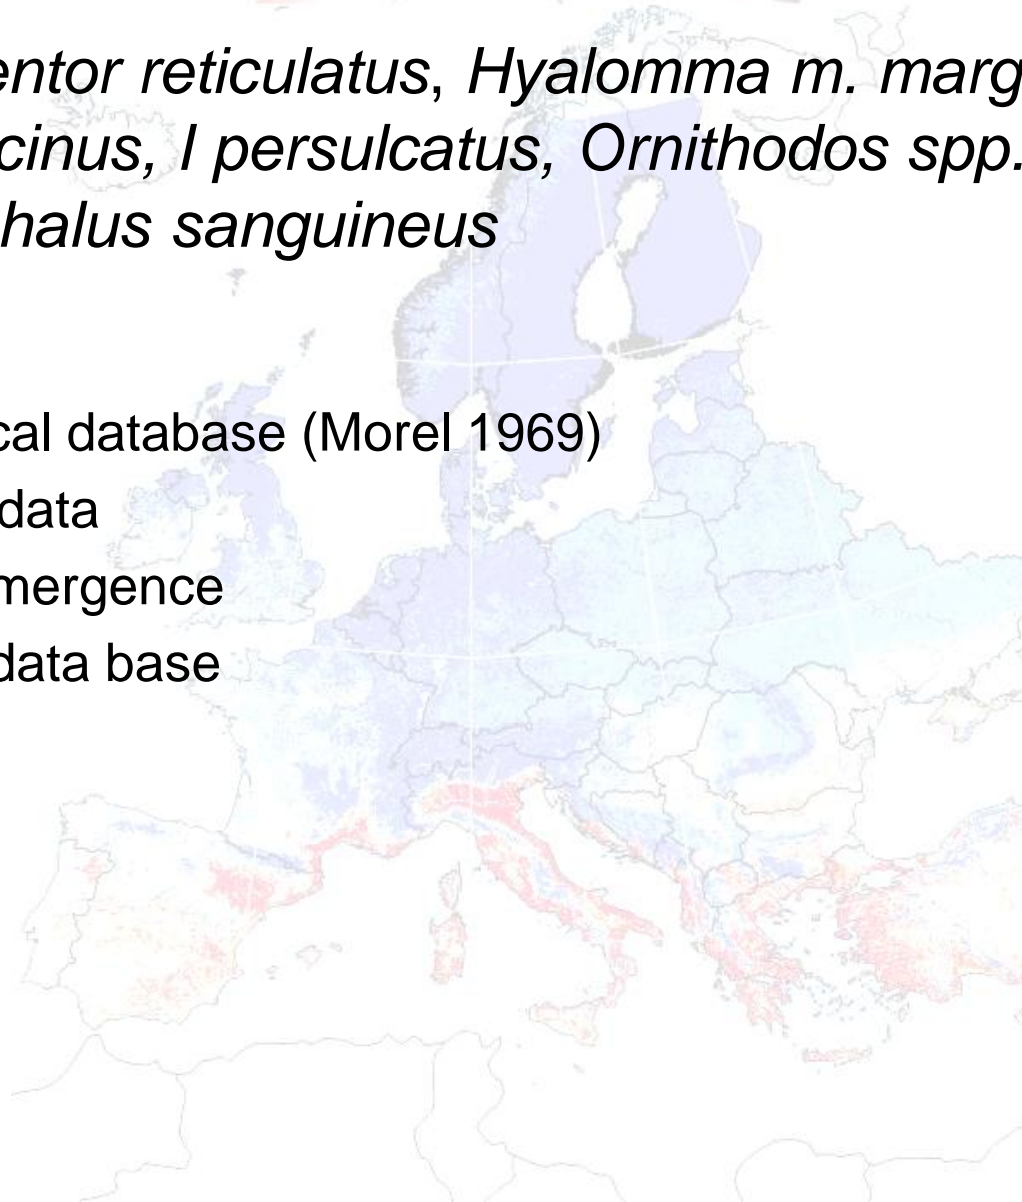

Coordination and data validation: Laurence VIAL

Ticks

- *Dermacentor reticulatus*, *Hyalomma m. marginatum*, *Ixodes ricinus*, *I. persulcatus*, *Ornithodos spp.*, and *Rhipicephalus sanguineus*
- Sources:
 - Historical database (Morel 1969)
 - EDEN data
 - ATP Emergence
 - EFSA data base

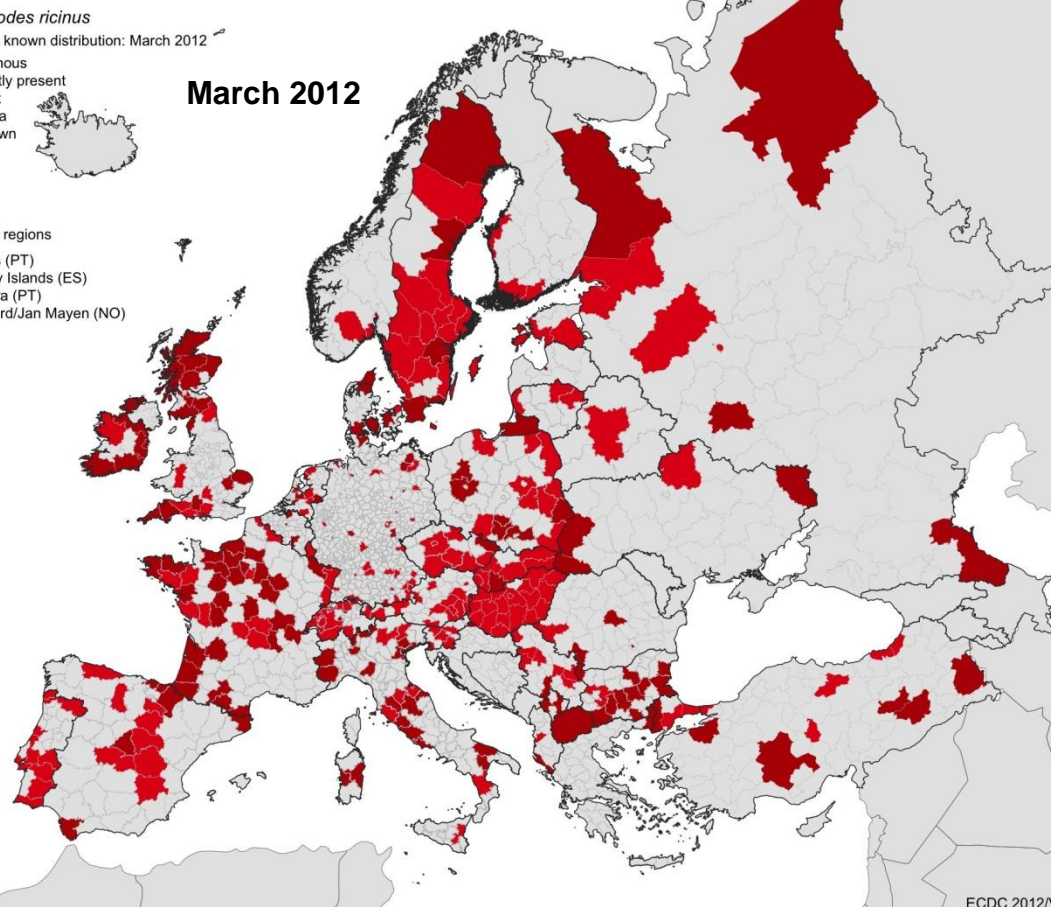

Ixodes ricinus (from EFSA sources)

Ixodes ricinus
Current known distribution: March 2012

- Indigenous
- Recently present
- Absent
- No data
- Unknown

March 2012

Current known distribution: January 2011

- Indigenous
- Recently present
- Absent
- No data
- Unknown

January 2011

ECDC 2011/VBORNE

Ticks – Perspectives

- Further data integration and validation
- Focus on limits of distribution areas
- Confirmation/validation request from tick experts
- Identify gaps and ambiguities
- Modelling approach for filling gaps: Defining suitable habitat envelope (distribution limits for each tick species using presence models)

Phlebotominae sand flies

Coordination and data validation: Bulent ALTEN

Phlebotominae

- *Phlebotomus ariasi*, *P. neglectus/syriacus*, *P. papatasi*, *P. perifiliewi*, *P. perniciosus*, *P. sergenti*, *P. similis*, *P. tobbi*
- New maps: *P. alexandri*, *P. mascitii*
- Sources:
 - Historical databases
 - Publications
 - EDEN and EDENext

Phlebotomus perniciosus

P. (Larrousius) perniciosus

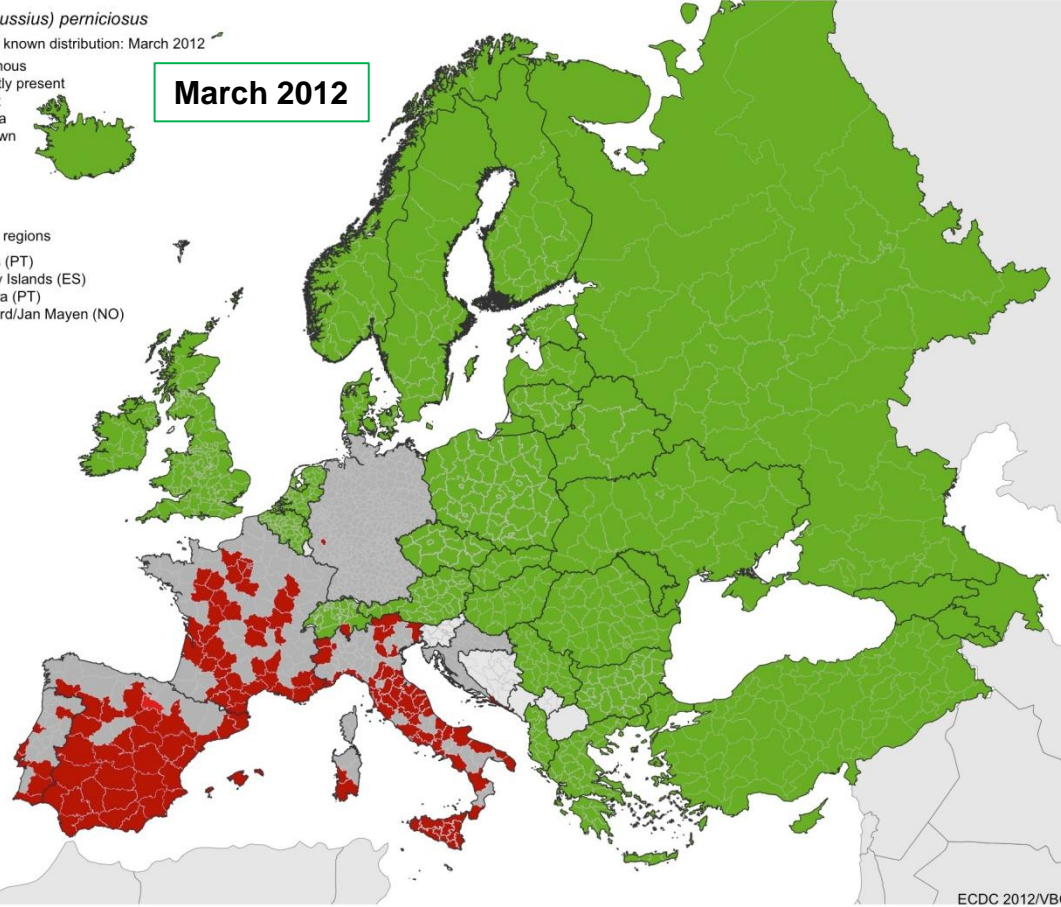

Current known distribution: March 2012

- Indigenous
- Recently present
- Absent
- No data
- Unknown

March 2012

Phlebotominae – Perspectives

- Further data integration and validation
- Focus on limits of distribution areas
- Confirmation/validation request from tick experts
- Identify gaps and ambiguities
- Modelling approach for filling gaps: Defining suitable habitat envelope (distribution limits for each tick species using presence models)

Overall perspectives

- Get more contributions from local experts
 - Now online tool
 - Data can be entered by consortium if needed/wanted
- Identify national databases
- Links with national and international projects
- Filling gaps with new data or modelling
